Processes are everywhere!

The behavior of a system is described using BPMN.

The data of a system is described using CD.

In this project, we aim to integrate these two models so that data from the data model can be accessed within the process model.

Goal

1. Create a CD
2. Create a BPMN
3. Generate the CD symbol table
4. Access the CD data from BPMN

- We meet once a week (or less if not needed)
- It is your responsibility to
 - Track and divide your tasks in Gitlab issues
 - Create working and **tested(!)** code
 - **!All implemented features must be tested!**
 - Schedule additional meetings if needed
 - Write documentation
- Your grade is determined from
 - Actual project implementation
 - Your presentation
 - The markdown documentation (~1000 words per person)
- All your work must be on the main branch of your Gitlab project at the deadline
 - Deadline for the project is 31.08.2026, 23:55
 - Presentation date is TBD
 - Also upload the presentation slides into your repo!

Documentation

- The documentation should include:
 - **Technical Documentation:** Provide in-depth documentation of the developed artifacts. This may include a Markdown overview, JavaDoc for Java source files, and inline comments for grammar definitions.
 - **User Manual:** Create a clear and concise manual for end users of the tool. A top-level Markdown file in the project repository is recommended.
 - **Project Limitations and Unmet Goals:** Document any technical constraints and goals that were not achieved. This will support planning and decision- making for future projects. A dedicated Markdown file is suitable for this purpose.
- Should not exceed 6000 words, but be no shorter than number of team members x 1000 words
